

Field-Cote® CRF SMART

More return with less work –
one application for the entire cultivation period

4 times better with Field-Cote® CRF SMART

Efficiency

Nutrition is delivered directly to the root zone, precisely tailored to temperature and needs.
Unique: the longest and most consistent release in its category.

Quality

Maximum plant quality through a balanced and long-lasting nutrient release at the roots.
Field-Cote® CRF SMART guarantees consistent nutrition, even under changing weather conditions.

Smart planting (Smart growing)

Optimised for machine application, also with GPS-controlled planting hole systems.
Less manual work, more precision.

Cost savings

Labor is becoming increasingly expensive.
With one application per crop and less leaching, Field-Cote® CRF SMART fits in perfectly with a sustainable and efficient cultivation strategy

'Perfectly distributed in the root zone'

The granules are constantly moist and well distributed around the roots. This keeps the release constant, with minimal leaching and maximum absorption. Much more effective than spreading on the surface.

SMART growing

Plant hole application in field-grown cultivation

Better result with 50% less N

6 year trials in collaboration with Delphy & Compas Agro
More length, better rooting

Trial with CRF in planting hole application, carried out by Delphy – Netherlands

Application steps Field-Cote® CRF (drill & planter)

1

Dose the CRF on the ground

Sprinkle the fertilizer before digging the planting hole or trench – exactly where you will be planting.

2

Make the planting hole or trench

Use a drill or planting machine so that the granules are evenly distributed in the soil.

3

Plant direct

Place the plant in the prepared hole or trench – this way the nutrients reach the roots directly.

Specifications

Grain size
