

Tray plant Base fertilization

Horti-Cote Plus® CRF
16+6+11+2MgO+TE 6M

Minimum release at the start
More control in the tray

Safe nutrition for strawberry tray plants: controlled initial release, minimal EC build-up and strong growth

The tray plant season is approaching again. For strawberry tray plants, trays are often filled with substrate weeks before planting. During this period, a low fertilizer application is important to prevent salt buildup in the tray.

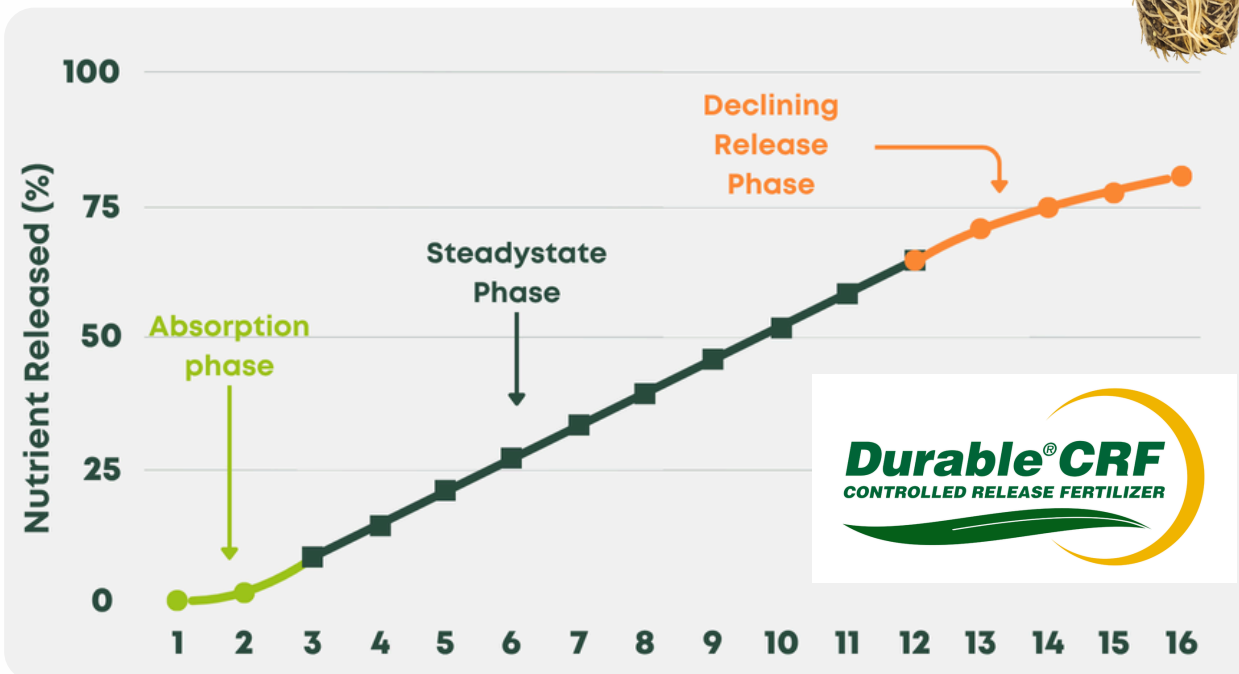

Horti-Cote Plus® CRF has a gentle initial release and releases nutrients when the plant begins to grow actively. This keeps the start safer and better under control.

Advantages

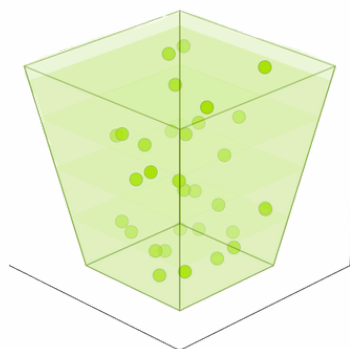

- **Controlled low release in the initial phase**
- **Minimizes leaching and EC buildup**
- **Lower risk of root burn (root infection)**
- **Good distribution due to high number of grains per gram (2-3mm)**
- **Biodegradable coating**

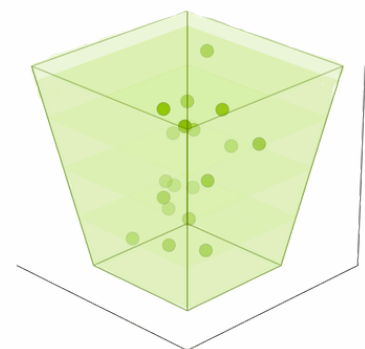

Release curve Horti-Cote Plus Durable[®] coating

Optimal grain distribution

Mivena: 48 pellets / gram
~32.4 pellets per 225cc

Other CRF: 28 grains per gram
~18.9 pellets per 225cc
